EDA Final Report - UCI Adult Dataset

Problem/Data Overview: 48,842 rows and 14 variables about demographics, work, and income.
Goal: inspect, clean, analyze, visualize, and explain income patterns using EDA.
Data Cleaning: removed duplicates, handled missing ? values, imputed categorical modes, and converted numeric columns to proper types.
Findings: higher education, age, and increased weekly work hours are linked with greater income. Capital gain shows significant dispersion and outliers.
Conclusion: the cleaned dataset is suitable for EDA and later predictive modeling tasks.
